Keywords: ash and slag waste; stakeholder matrix; project approach; risk; waste disposal; environmental safety.

Abstract: A number of problems in waste transportation and disposal are defined using regional eco-operators as an example, and ways to solve them and ideas for improving the environmental situation are proposed. The paper proposes a vector of changing business processes for waste collection and transportation companies – organizing separate waste collection. A stakeholder matrix, reflecting the stakeholders of the project, which are targeted at solving the problem, is presented.
