Keywords: contextual training; information environment; information technology; language competence.

Abstract: The article discusses the use of metasubject informatics capabilities to solve the problems of formation of language competence. A contextual approach developed by A. A. Verbitsky, the Academician of RAO is an effective way of developing the language competence by using the informatics elements. The authors examined the main components of the language competence formulated in “Modern Languages: Learning, Teaching, Assessment. A Common European Framework of Reference” and formulated approaches to the use of informatics in the contextual formation of each of the components.
