Keywords: cultural heritage object; integration; public space; restoration; historical urban environment; environment transformation scenarios.

Abstract: Preservation of the architectural heritage concentrated in the historical center of the city cannot be achieved only through the means of restoring cultural heritage sites; it is required to develop a concept of change management with the aim of creating an integrated historical, city-building urban environment. The problem of creating an integrated urban environment of the historical center is considered from the point of view of the system-structural approach. As a result of the analysis, functional, social, environmental and phenomenological indicators of development were determined, forming a system of layers of integration. The developed scenarios for the transformation of the historical and town-planning environment, taking into account the restoration of cultural heritage sites, will create an integrated space in the architectural and spatial and temporary development.
