Keywords: livestock farm; root crops; cattle; cooking; efficiency.

Abstract: Improving the productivity of animals based on improving the quality of preparation of root crops is of paramount importance. By changing the level and mode of feeding, the set and ratio of feed in the diet, you can affect the entire metabolism and form the desired type of animal, capable of high milk or meat productivity. Only rational, normalized feeding using modern achievements of science and practice can fully ensure high animal productivity, improve the quality of livestock products and reduce its cost. Without solving the problem of full-fledged feeding of animals, it is impossible to increase the production of livestock products.
