Keywords: goalball; development of specific coordination abilities; athletes with visual impairments.

Abstract: An attempt was made to determine the sports-specific coordination abilities necessary for goalball player for productive performance. The features of their manifestation were revealed taking into account the complete or partial visual deprivation of athletes, as well as the features of physical and technical fitness in goalball. Recommendations are given on the selection of means and methods for developing the ability to react, rebuild, orient and differentiate the parameters of goalball players' movements during the training process.
