Keywords: green economy; making decisions; natural-to-industrial systems; sustainable development management system; sustainable development.

Abstract: The circulation and green economy are recognized as the main directions in solving the problem of sustainable development of civilization. They are based on the ideas of complex processing of raw materials and materials, saving resources, creating technologies that are friendly to nature, and a number of others. At the same time, the mechanism for transferring existing objects of the regional economy to the trajectory of sustainable development remains unclear. To answer this question, it is necessary to develop the theory and methods of long-term planning and management of socio-economic and environmental processes.
