**Keywords:** unemployment; employment; labor market; employment service.

**Abstract:** The article presents the results of the assessment of the employment services in the regional context of the the Volga Federal District (VFD). The information base of the study was formed by the results of a sample survey of the quality and availability of services in the fields of education, health care and social services, assistance to employment of the population, carried out by Rosstat in 2023. The final information base of the study was implemented in the SPSS computer environment template and is presented on the Rosstat website. The number of observations by persons in the Russian Federation as a whole was 110,265 people; the number of variables was 602. The reasons for the poor performance of regional employment services were established. The assessment was carried out for the employment services of the Penza, Ulyanovsk and Kirov regions, as the most typical representatives of the average level of socio-economic development, and the Republic of Tatarstan, as a traditional leading subject not only in the VFD, but also in the Russian Federation as a whole. It is indicated that the results and conclusions obtained on the basis of a sample survey are preliminary in nature, with a certain degree of probability. The developed ways of improving the activities of services represent vectors of movement in the right direction. It is noted that the Kirov region, within the framework of a sample survey, is the leader in most indicators related to employment of the population.
